BUSINESS INSIGHTS BASED ON DISCOVERIES DURING THE EXPLORATION OF THE DATA

Real Business Insights Discovered

1. The "111111" Impact (Found via Column Profiling)

When turning on **Column Profiling**, the *Column Quality* indicators showed that over 1,000 rows in the Customer_ID column were completely blank (null). Instead of deleting them, I realized these represent customers checking out as guests without making an account. By keeping these rows, the dashboard shows that guest checkouts actually bring in a huge chunk of money. Deleting them would have made our total revenue look much lower than it actually is.

2. Negative Outliers Mess Up the Data

During the data profile check, the minimum values for quantity and price showed negative numbers. This happens when the system logs returns or order cancellations. If we don't filter these out of our main sales charts, they cancel out regular sales and mess up our revenue tracking. Filtering them into their own category keeps our main dashboard numbers accurate.

3. Relying Too Heavily on the UK Market

By looking at the map and cross-filtering the charts, it is immediately obvious that **over 80% of all sales** come from the UK (Domestic) market. Even though the business ships internationally, it relies almost entirely on local UK buyers. This is a big risk for the business because if the UK economy slows down, sales will drop drastically. The business needs to start marketing more heavily to international segments to split the risk.

- **Treemap ("Top Performing Products"):** Shows our best-selling items based on quantity.
- **Gauge Visual:** Compares our current total sales against a fixed target goal.
- **Matrix Grid:** A pivot table crossing years and quarters to show sales trends.
- **Detailed Table:** A row-by-row lookup table at the bottom for auditing specific transaction details.
